WHAT IS CLAIMED IS:

	WIND IS CERTIFIED IS.			
	SWB			
1	A wireless communication system comprising:			
2	a plurality of access points, each access point having at least one			
3	omnidirectional antenna forming a substantially uniform coverage area around the			
4	access point; and			
5	a plurality of subscriber units each subscriber unit having at least one			
6	directional antenna forming a directional coverage area, each subscriber unit			
7	communicating with a particular access point through transmissions between the			
8	subscriber unit directional antenna and the omnidirectional antenna for the particular			
9	access point.			
1	2. A wireless communication system as in claim 1 further			
2	comprising a routing network interconnecting the plurality of access points.			

- A wireless communication system as in claim 2 wherein the 3. routing network comprises a distributed network of distribution points.
- wireless communication system as in claim 3 wherein at 4. least one distribution/point is in the same location as one access point.
- A wireless communication system as in claim 2 wherein at least one access point is in wireless communication with the routing network through at least one backhaul antenna.
- A wireless communication system as in claim 1 wherein transmissions between the subscriber unit and the access point comprise packetized information.
- A wireless communication system as in claim 1 wherein the 7. subscriber unit is a terminal network controller comprising at least one interface, each interface providing access to the wireless communication system.

- directional antenna comprises a plurality of antenna/patches, the subscriber unit selecting at least one antenna patch as the directional antenna.
- A wireless communication system as in claim 1 wherein the 10. directional antenna is operative to be positioned/to optimize transmissions between the subscriber unit and the particular access point.
- A wireless communication system as in claim 1 further 11. comprising:

a plurality of access points, each access point having at least one directional antenna forming a coverage sector around a portion of the access point; and

a plurality of subscriber units, each subscriber unit having at least one omnidirectional antenna forming a substantially uniform coverage area around the subscriber unit, each subscriber unit communicating with a particular access point through transmissions between the subscriber unit omnidirectional antenna and the directional antenna for the particular access point.

- A wireless communication system as in claim 11 wherein at 12. least one access point has both at least one omnidirectional antenna and at least one directional antenna.
- A wireless communication system as in claim 11 wherein 13. access points transmit from omnidirectional antennas at a first frequency and from directional antennas at/a second frequency different than the first frequency.
 - A method of wireless communication comprising: 14.

With Staff Staff Staff

area around each of a plurality of access points receiving the downlink information at a subscriber unit; transmitting uplink information in a focused coverage area from to subscriber unit; and receiving the uplink information at one of the access points. 15. A method of wireless communication as in claim 14 where transmitting in the substantially uniform coverage area around each of the access points comprises transmitting from an omnidirectional antenna and receiving to uplink information comprises receiving at the omnidirectional antenna. 16. A method of wireless communication as in claim 14 where transmitting in a focused coverage area comprises transmitting from a direction antenna and receiving the downlink information comprises receiving at the directional antenna. 17. A method of wireless communication as in claim 16 furth comprising selecting at least one of a plurality of antenna patches to form to directional antenna. 18. A method of wireless communication as in claim 16 furth comprising aiming the directional antenna to improve receiving the downling information. 19. A method of wireless communication as in claim 14 where downlink information and uplink information comprises packetized information. 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.					
receiving the downlink information at a subscriber unit; transmitting uplink information in a focused coverage area from to subscriber unit; and receiving the uplink information at one of the access points. 15. A method of wireless communication as in claim 14 where transmitting in the substantially uniform coverage area around each of the access points comprises transmitting from an omnidirectional antenna and receiving to uplink information comprises receiving at the omnidirectional antenna. 16. A method of wireless communication as in claim 14 where transmitting in a focused coverage area comprises transmitting from a direction antenna and receiving the downlink information comprises receiving at the directional antenna. 17. A method of wireless communication as in claim 16 furth comprising selecting at least one of a plurality of antenna patches to form the directional antenna. 18. A method of wireless communication as in claim 16 furth comprising aiming the directional antenna to improve receiving the downling information. 19. A method of wireless communication as in claim 14 where downlink information and uplink information comprises packetized information. 20. A method of wireless communication as in claim 14 furth comprising routing information thetween the plurality of access points.	2	transmitting downlink information in a substantially uniform coverage			
transmitting uplink information in a focused coverage area from to subscriber unit; and receiving the uplink information at one of the access points. 1	3	area around each of a plurality of access points			
receiving the uplink information at one of the access points. 1	4	receiving the downlink information at a subscriber unit;			
receiving the uplink information at one of the access points. 1	5	transmitting uplink information in a focused coverage area from the			
1 15. A method of wireless communication as in claim 14 where transmitting in the substantially uniform coverage area around each of the access points comprises transmitting from an omnidirectional antenna and receiving the uplink information comprises receiving at the omnidirectional antenna. 1 16. A method of wireless communication as in claim 14 where transmitting in a focused coverage area comprises transmitting from a direction antenna and receiving the downlink information comprises receiving at the directional antenna. 1 17. A method of wireless communication as in claim 16 furth comprising selecting at least one of a plurality of antenna patches to form the directional antenna. 1 18. A method of wireless communication as in claim 16 furth comprising aiming the directional antenna to improve receiving the downling information. 1 19. A method of wireless communication as in claim 14 where downlink information and uplink information comprises packetized information. 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.	6	subscriber unit; and			
transmitting in the substantially uniform coverage area around each of the acce points comprises transmitting from an omnidirectional antenna and receiving the uplink information comprises receiving at the omnidirectional antenna. 1 16. A method of wireless communication as in claim 14 where transmitting in a focused coverage area comprises transmitting from a direction antenna and receiving the downlink information comprises receiving at the directional antenna. 1 17. A method of wireless communication as in claim 16 furth comprising selecting at least one of a plurality of antenna patches to form the directional antenna. 1 18. A method of wireless communication as in claim 16 furth comprising aiming the directional antenna to improve receiving the downlink information. 1 19. A method of wireless communication as in claim 14 where downlink information and uplink information comprises packetized information. 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.	7	receiving the uplink information at one of the access points.			
transmitting in the substantially uniform coverage area around each of the acce points comprises transmitting from an omnidirectional antenna and receiving the uplink information comprises receiving at the omnidirectional antenna. 1 16. A method of wireless communication as in claim 14 where transmitting in a focused coverage area comprises transmitting from a direction antenna and receiving the downlink information comprises receiving at the directional antenna. 1 17. A method of wireless communication as in claim 16 furth comprising selecting at least one of a plurality of antenna patches to form the directional antenna. 1 18. A method of wireless communication as in claim 16 furth comprising aiming the directional antenna to improve receiving the downlink information. 1 19. A method of wireless communication as in claim 14 where downlink information and uplink information comprises packetized information. 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.					
points comprises transmitting from an omnidirectional antenna and receiving to uplink information comprises receiving at the omnidirectional antenna. 1 16. A method of wireless communication as in claim 14 where transmitting in a focused coverage area comprises transmitting from a direction antenna and receiving the downlink information comprises receiving at the directional antenna. 1 17. A method of wireless communication as in claim 16 furth comprising selecting at least one of a plurality of antenna patches to form the directional antenna. 1 18. A method of wireless communication as in claim 16 furth comprising aiming the directional antenna to improve receiving the downlink information. 1 19. A method of wireless communication as in claim 14 where downlink information and uplink information comprises packetized information. 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.					
uplink information comprises receiving at the omnidirectional antenna. 1		,			
1 16. A method of wireless communication as in claim 14 where transmitting in a focused coverage area comprises transmitting from a direction antenna and receiving the downlink information comprises receiving at the directional antenna. 1 17. A method of wireless communication as in claim 16 furth comprising selecting at least one of a plurality of antenna patches to form the directional antenna. 1 18. A method of wireless communication as in claim 16 furth comprising aiming the directional antenna to improve receiving the downling information. 1 19. A method of wireless communication as in claim 14 where downlink information and uplink information comprises packetized information. 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.	3				
transmitting in a focused coverage area comprises transmitting from a direction antenna and receiving the downlink information comprises receiving at the directional antenna. 1	4	uplink information comprises receiving at the omnidirectional antenna.			
transmitting in a focused coverage area comprises transmitting from a direction antenna and receiving the downlink information comprises receiving at the directional antenna. 1					
antenna and receiving the downlink information comprises receiving at the directional antenna. 1	1	/			
directional antenna. 1	2	transmitting in a focused coverage area comprises transmitting from a directional			
1 17. A method of wireless communication as in claim 16 furth comprising selecting at least one of a plurality of antenna patches to form to directional antenna. 1 18. A method of wireless communication as in claim 16 furth comprising aiming the directional antenna to improve receiving the downling information. 1 19. A method of wireless communication as in claim 14 where downlink information and uplink information comprises packetized information. 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.	3	antenna and receiving the downlink/information comprises receiving at the

1 19. A method of wireless communication as in claim 14 where downlink information and uplink information comprises packetized information. 1 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.	2	comprising aiming the directional antenna to improve receiving the downlink			
downlink information and uplink information comprises packetized information. 1 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.	3	information.			
downlink information and uplink information comprises packetized information. 1 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.					
1 20. A method of wireless communication as in claim 14 furth comprising routing information between the plurality of access points.	1	19. A method of wireless communication as in claim 14 wherein			
2 comprising routing information between the plurality of access points.	2	downlink information and uplink information comprises packetized information.			
2 comprising routing information between the plurality of access points.					
	1	20. A method of wireless communication as in claim 14 further			
1 21. A method of wireless communication as in claim 20 where	2	comprising routing information between the plurality of access points.			
	1	21. A method of wireless communication as in claim 20 wherein			

routing information comprises:

2

	/				
3	receiving the information in a distribution point;				
4	sending the information to an access point in communication with the				
5	distribution point if the information is destined for a subscriber unit in				
6	communication with the access point;				
7	otherwise, forwarding the information to another distribution point is				
8	communication with the distribution point.				
1	22. A method of wireless communication as in claim 20 wherein				
2	routing information comprises transmitting the information between each access poin				
3	and one of a plurality of distribution points.				
1	23. A method ϕ f wireless communication as in claim 22 wherein				
2	transmitting the information comprises wireless transmission.				
1	24. A method of wireless communication as in claim 22 wherein				
2	at least one access point is in the same location as at least one distribution point.				
1	25. A method of wireless communication as in claim 14 further				
2	comprising routing the downlink information to one of a plurality of interfaces at the				
3	subscriber unit.				
1	26. A method of wireless communication as in claim 14 further				
2	comprising:				
3	transmitting downlink information in a focused coverage area around				
4	each of a plurality of access points				
5	receiving the downlink information at a subscriber unit;				
6	transmitting uplink information from a substantially uniform coverage				
7	area around the subscriber unit; and				
8	receiving the uplink information at one of the access points.				
1	2/7. A method of wireless communication as in claim 26 wherein				
2	at least one access point both transmits downlink information in a focused coverage				

area and transmits downlink information in a substantially uniform coverage area.

\ \	\	•	

28. A method of wireless communication as in claim 26 wherein
downlink information transmitted in the substantially uniform coverage area is
transmitted at a first frequency and downlink information transmitted in the focused
coverage area is transmitted at a second frequency different than the first frequency.
29. A wireless communication system comprising:
a plurality of access points, each access point transmitting and
receiving information packets, each information packet transmitted over a
substantially uniform coverage area around the access point;
a network of distribution points in communication with the access
points, the distribution points routing information packets between the access points;
and
a plurality of subscriber units, each subscriber unit transmitting and
receiving information packets each subscriber unit transmitting information packets
over a focused directional coverage area.
. 30. A wireless communication system for communicating with a
plurality of subscriber units, the system comprising:
a plurality of access points, each access point having an
omnidirectional antenna; and
a plurality of subscriber units, each subscriber unit having a
directional antenna;
wherein each access point forms a communication link with at least
one subscriber unit by transmitting information packets between the access point
omnidirectional antenna and the subscriber unit directional antenna.
·
31. A method of communicating comprising:
establishing a plurality of access points, each access point having an
omnidirectional antenna;
transmitting information packets in a uniform coverage area around
each access point; and

6 A 7 receiving information packets at each access point, the received information points transmitted from a directional antenna in each of a plurality of subscriber units.
